The McLanahan Horizontal Manure Auger Conveyance System

Horizontal Manure Augers eliminate the need to turn manure out of the barns. Our augers can be integrated with tire scrape and or alley scrapers. The augers are designed to transfer sand-laden manure into a reception tank or storage. Multiple augers can be installed in series (push/pull arrangements).

Specifications

Installation:

Auger systems are typically installed at the cross alley (center or end of barn) or at the end of the barn. The auger is mounted into a concrete trough specified by McLanahan Corporation. The auger is positioned in the trough so there is no contact between flights and concrete.

Length:

Single augers are available in lengths up to 168 feet. Multiple Augers can be installed end to end to achieve any length necessary over 168 feet.

Power Requirements:

Power requirements vary with auger length. The longer the auger, the more power required. Single phase and three phase motors available. We also offer hydraulically driven systems.

Safety:

McLanahan offers grates and plates with each system as an option. If customer chooses not to purchase grates and plates through McLanahan Corporation the customer is liable and will take full safety responsibility.

For more information on our Horizontal Manure Auger Conveyance Systems, call or email McLanahan Corporation.
